Alkyd Resins Technology

Alkyd resin, a complex oil-modified polyester that serves as the film-forming agent in some paints and clear coatings. Developed in the 1920s, alkyd-based enamel paints were once one of the most important types of surface coating. Owing to their incorporation of volatile organic solvents and to their low durability on exterior surfaces, they have yielded preeminence to newer polymer systems

Alkyd resins can be regarded as a class of modified condensation polymers. 73 Originally, alkyd resins were merely the reaction products of phthalic anhydride and glycerin, and were too brittle to make satisfactory coatings. However, the use of fatty oils or unsaturated fatty acids in combination with the brittle alkyds resulted in flexible, glossy, air-drying coatings, which at the time of ...

An alkyd is a polyester modified by the addition of fatty acids and other components. They are derived from polyols and a dicarboxylic acid or carboxylic acid anhydride. The term alkyd is a modification of the original name "alcid", reflecting the fact that they are derived from alcohol and organic acids. The inclusion of the fatty acid confers a tendency to form flexible coating.

Alkyd resins are any of a large group of thermoplastic resins that are essentially polyesters made by heating polyhydric alcohol with polybasic acids or their anhydride and used chiefly in making protective coatings and good weathering properties. These resins are useful as film forming agents in paint, varnished and enamels & as thermosetting plastics that can be moulded into solid objects.

From this technology a new family of thixotropic alkyd resins for decorative applications has been developed and introduced. This new family, based on aramide chemistry, exhibits a number of important features which make it eminently suitable for use in high solid and high gloss decorative paint- and stain applications.

Extensive durability tests showed that the new modified core-shell alkyd resins provide stain formulations that perform well under a variety of conditions. In the lab, samples were run using ASTM G155 exposure conditions and 0.35W/m² irradiation, a black panel temperature of 63 +3 °C with a water spray cycle for 1000 h or until failure.

As indicated, alkyd resins are polyester-based materials that are normally modified with oil or fatty acids. These products may be further modified with a variety of other chemical materials. Various polybasic acids, polyhydric alcohols, oils, fatty acids and modifying agents may be combined to produce alkyds with specifically designed properties.

Abstract. The term alkyd was first used by Kienle in 1927 to describe the polyesters resulting from the reaction of polyhydric alcohols and polyfunctional acids. It was discovered that the characteristics of such resins could be improved by modifying the alkyd with oil to give oil-modified alkyds. With the universal acceptance of coatings based on these resins, the oil-modified was eventually ...
